

nSSF

A Windows software for the determination of neutron self-shielding correction factors

(Draft) User guide / Current version: v0.9 (Beta)

by F. Farina Arboccò

email: fulviofarina@usb.ve

The screenshot displays the nSSF software interface. The main window is titled "SSF Calculations". It features a sidebar on the left with sections for "Sample variables", "Neutron Source parameters", and "Run-time Information". The "Sample variables" section includes a table with columns: Mass (mg), Radius (mm), Length (mm), Density, and Volume (cm3). The "Neutron Source parameters" section includes fields for Radius (mm), Length (mm), Bell factor, Configuration, Wgt, n Factor, kTh, kEpi, pTh, and pEpi. The "Run-time Information" section includes a status bar with "OK" and "CHECKED" buttons, and a text area for "Data for this item seems OK".

The main area of the window displays a table of calculation results. The table has columns: Sample, OK, Gt(M), Gt(CKS), MCL, EXS, and PXS. The data is as follows:

Sample	OK	Gt(M)	Gt(CKS)	MCL	EXS	PXS
170601	OK					
170602	OK	0.9389		6.1790	0.2913	0.0618
170603	OK	0.8864		3.2560	0.5527	0.0326

Below this table is another table with columns: Target, Formed, Ge(M), Ge(CKS), GFast, Weight, ND, and Sig. The data is as follows:

Target	Formed	Ge(M)	Ge(CKS)	GFast	Weight	ND	Sig
C-12	C-13				34.61	1.13E-001	8.28E+001
C-13	C-14				0.41	1.22E-003	8.08E+003
Ca-40	Ca-41			0.9960	17.28	1.70E-002	5.82E+002
Ca-42	Ca-43			0.9957	0.12	1.13E-004	8.73E+004
Ca-43	Ca-44			0.9976	0.03	2.36E-005	4.19E+005
Ca-44	Ca-45			0.9969	0.41	3.65E-004	2.71E+004
Ca-46	Ca-47	1.0000		0.9976	0.00	7.01E-007	1.41E+007
Ca-48	Ca-49	1.0000		0.9979	0.04	3.28E-005	3.02E+005
H-1	H-2			0.9978	4.50	1.75E-001	3.60E+001
H-2	H-3			0.9967	0.00	2.02E-005	4.91E+005
N-14	N-15			0.9978	2.74	7.68E-003	1.28E+003
N-15	N-16			0.9832	0.01	2.81E-005	3.53E+005
Na-23	Na-24	0.9965		0.9923	0.50	8.54E-004	1.16E+004
O-16	O-17			0.9978	14.35	3.52E-002	2.77E+002
O-17	O-18			0.9951	0.01	1.34E-005	7.38E+005
O-18	O-19				0.03	7.24E-005	1.37E+005

The status bar at the bottom shows "170603" with a "Changed on" date of "5/28/2017 07:30" and a "Calculated on" date of "5/28/2017 07:33".

Making a Project

1. In the “Project Box”, as shown in the figure, type in the name of the project you would like to create.

A screenshot of a software interface with an orange header bar containing a small icon and the text "SSF Calculations". Below the header, the word "PROJECT" is displayed in purple. To its right is a dark grey rectangular text input field.

You could type for instance:

“X1706”

as a nemonic for project X on the year 2017 and month 06 (June).

For the moment, we strongly advice to use a letter (or series of letters) followed by a series of numbers of your choice. The ability to employ any label for a project will be added in the forecoming versions.

A screenshot of the same software interface as before, but now the text input field contains the characters "x1706". The text is highlighted with a blue selection box.

2. Press **ENTER** to create the project. A confirmation dialog will show up.

A screenshot of a confirmation dialog box. It has an orange header bar with the word "Important" and a close button (X). Below the header, there is a blue circular icon with a white 'i' followed by the text "This Project does not exist yet (not found). Would you like to create a new one?". At the bottom, there are two buttons: "Yes" and "No". The "Yes" button is highlighted with a blue dashed border.

3. After clicking **YES** a confirmation dialog will show up.

Project X1706 created

Project created.

Please add some samples to it...

OK

Adding samples

4. In order to add a sample, employ the yellow **Plus (+) Button** located in the “**Navigation Bar**”

5. A new sample is added and its particular sample information (or input data) is displayed at the application left-hand side-panel:

On top you will identify the typical **Sample variables** for cylindrical samples:

Radius (in mm), **Length** (in mm), **Density** (in g/cm^3), **Mass** (in mg) and **Volume** (in cm^3).

Grey cells indicate that the value is automatically calculated each time one of the **White** cell values is **validated**.

Sample

170601

1 of 1

+

×

Description

CHANGE VIEW

Sample variables

Mass (mg)	Radius (mm)	Length (mm)	Density	Volume (cm3)
0.0	0.000	0.000	0.000	0.000

Neutron Source parameters

Radius (mm)	50.000	Length (mm)	500.000
Bell factor	1.300	Configuration	1 = Wire flat
WGt	0.930	n Factor	0.500
kTh	0.601	kEpi	1.000
pTh	0.964	pEpi	0.820

For instance, the Mass is recalculated each time the Radius, Length or sample Density is modified and **validated**.

6. Type in the desired sample value in a given White cell **and press ENTER to validate the value.**

7. Add more samples to your project. These samples will appear in the application right-panel (see the figure below).

You can navigate/select which sample you would like to modify by selecting any cell of the respective data row →

▶

170603

Sample	OK	Gt(M)	Gt(CKS)	MCL	EXS	PXS
170601						
170602						
170603						

The previous grid will also display the overall sample results from the calculations, i.e.:

- **Gt(M)** refers to the **Thermal** neutron self-shielding correction factor according to the MatSSF method.
- On the other hand the **Gt(CKS)** value refers to the **Thermal** neutron self-shielding correction factor according to the Chilian-Kennedy Sigmoid method.

MCL	EXS	PXS
6.1790	0.2913	0.0618
3.2560	0.5527	0.0326

- The **MCL** corresponds to the **Mean-chord length**.
- The **EXS** value corresponds to the **Escape cross-section**.
- The **PXS** value corresponds to the **Potential cross -section**.

Below there is another grid that will show the sample specific results for each formed nuclei (available in the library) present in the sample.

Target	Formed	Ge(M)	Ge(CKS)	GFast	Weight	ND	Sig
--------	--------	-------	---------	-------	--------	----	-----

- **Ge(M)** refers to the **Epithermal** neutron self-shielding correction factor according to the MatSSF method.
- On the other hand the **Ge(CKS)** value refers to the **Epithermal** neutron self-shielding correction factor according to the Chilian-Kennedy Sigmoid method.
- **GFast(M)** refers to the **Fast** neutron self-shielding correction factor according to the MatSSF method.
- The **ND** value corresponds to the Nuclei Density.
- The **Sig** value corresponds to the cross-section.

Other sample information is available on the bottom of this panel, as shown below:

170601	<i>Changed on</i>	5/28/2017 06:56	<i>Calculated on</i>	5/28/2017 06:56
--------	-------------------	-----------------	----------------------	-----------------

This right-panel is allways accesible through the “Samples” panel.

IMPORTANT: PREFERENCES

It is possible to change which sample parameter gets automatically recalculated by accesing the “**Preferences**” menu located in the “**Options**” menu (see the figure below)

By clicking “**Preferences**” a pop-up menu will appear. You can choose wether you would like to automatically recalculate the **Density**, the **Radius** or the **Length** of the sample by chekcing these boxes. In order to automatically recalculate the sample **Mass**, you need to uncheck all these boxes.

Close the **Preferences** menu.

Templates!

One of the main ideas of this program is to be able to reuse sample “**Matrices**” (or Compositions), “**Containers**” and **neutron** “**Sources**” that are already present in the database.

8. Acces the “**Templates**” right-panel according to the following figure:

Under this panel you can access 3 different types of Templates.

Containers

9. By selecting “Containers” you can acces a templates list of different containers to choose.

Container dimensions					
		1	of 10		
	Label	Radius (mm)	Length (mm)	Vol (cm3)	Comments
▶	Source	1	0.1	0.000	Reference (REF)
	W	4	7.3	0.367	W00
	H	4	0.8	0.040	H00
	V	4.05	2.55	0.131	V00
	Vf	4.05	2	0.103	Vf00
	D	4.08	13.4	0.701	D00
	T	4.08	5.4	0.282	T00
	R	4.95	15.2	1.170	R00
	732	7.4	10	1.720	
	733	9.6	2.5	0.724	

10. You can also create more containers and/or modify their values by selecting the respective cell and typing its value.

	Source	1	0.1	0.000	Reference (REF)
▶	W	4	7.3	0.367	W00
	H	4	0.8	0.040	H00

- 11.** In order to **ASSIGN** the (template) container dimensions to the sample, **DOUBLE-CLICK** on the respective row header of the container

The **Radius** and **Length** values of the **selected container** will replace the **Radius** and **Length** values of the **sample**:

Sample variables				
Mass (mg)	Radius (mm)	Length (mm)	Density	Volume (cm3)
0.0	4.050	2.550	0.000	0.131

IMPORTANT

Modifying the values of a given template item **will not automatically modify** the values in the respective associated sample. This is done in order to ensure that each sample parameter can be modified later at will by the user. The template values are only **meant to be cloned** each time the user double-clicks on the respective item.

However, the templates are **internally linked** (associated) to the respective sample. Linking is performed to ensure that further versions of the program will allow for restoration off the sample parameters to the default template values if the user chooses to.

or,

#Element (%Content)

#Formula (%Content)

Examples:

#Al (50) #Fe (33.3) #Gd (16.7)

#Al₂O₃ (20) #Ba₁O₁ (60) #Mn (20)

Nota Bene: When inputting formulas, you will need to input explicitly the number “1” that is typically implicit for a given formula. This is not necessary when inputting pure elements.

Examples:

#BaO is **incorrect**, while #Ba₁O₁ is **correct**.

#Fe is **correct**.

The program allows for inputting complex samples, such as e.g. a Monazite mineral:

Content of:	Monazite	
#Ce ₂ O ₃ (26)	#La ₂ O ₃ (11)	#Nd ₂ O ₃ (10)
#Th ₁ O ₂ (7)	#Y ₂ O ₃ (3.2)	#Pr ₆ O ₁₁ (2.9)
#Sm ₂ O ₃ (2.3)	#Gd ₂ O ₃ (1.7)	#P (35)
#U ₁ O ₂ (0.4)		

When your mouse leaves the area, the matrix content grid gets updated displaying the new list of compositions (see the figure below).

Content of: Monazite		
Element or Formula	Quantity	Unit
U1O2	0.4	%
P	35	%
Gd2O3	1.7	%
Sm2O3	2.3	%
Pr6O11	2.9	%
Y2O3	3.2	%
Th1O2	7	%
Nd2O3	10	%
La2O3	11	%
Ce2O3	26	%

- 15.** In order to ADD a (template) matrix to the sample, DOUBLE-CLICK on the respective row header of the item 

The matrix is cloned/copied into the list of sample matrices located on the main left panel. The cloned matrix will show up in the “**Composition View**” as in the following figure:

Sample 170602

Description

[SWITCH VIEW](#)

1 of 1

Content of: Mylar

Label	Density (g/cm3)
Mylar	1.4

Element or Formula	Quantity	Unit
C	62.5	%
O	33.3	%
H	4.2	%

The sample and neutron source panel can be accessed back by clicking on the [CHANGE VIEW](#) button.

Nota bene: When you adopt **the first** matrix template, its **Density** value is copied to the **sample Density** and the respective Grey cell is recalculated (e.g. the Mass).

Sample variables				
Mass (mg)	Radius (mm)	Length (mm)	Density	Volume (cm3)
981.1	4.080	13.400	1.400	0.701

16. Modify the content of the sample matrix as in the previous example:

Content of:		Mylar		
#C	(62.5)	#O	(33.3)	#H (4.2)

IMPORTANT

You can add to the sample as many clones of template matrices as you want. However, modifying the content of a matrix associated to a sample **will not automatically** modify the content of a template matrix, and viceversa. Once again, this is to ensure that each sample can be specific and modified at will. Further program versions will allow for the option of restoration of sample values from associated template data if desired.

Still, you can modify the template matrix and re-adopt the updated values into the sample by double-clicking **again** the row header of the modified template matrix (a manual **Matrix UPDATE**).

Neutron Sources

1 Containers | 2 Matrices | 3 Sources

17. By selecting “Sources” you can access a templates list of different neutron sources configurations and dimensions to choose.

On the top grid the user can choose from a list of Neutron source “**Configurations**” and “**Dimensions**”, which are basically fixed (fundamental) neutron source parameters for a given neutron source.

Neutron source configurations										
	Label	Prefix	Configuration	Bell Factor	WGt	nFactor	kth	kepi	pTh	pEpi
	S84	Z	1 = Wire flat	1.3	0.93	0.5	0.6449	1	0.964	0.820
▶	Y4	X	1 = Wire flat	1.3	0.93	0.5	0.601	1	0.964	0.820
Neutron source dimensions										
	Label	Radius Δ	Length	Vol	Comments					
	S84	40	300	1,507.964	S84					
	PE50	45	220	1,399.580						
	PE20	47	560	3,886.276						
▶	Y4	50	500	3,926.991	Y4					
	PE200	60	340	3,845.309						
	P100	85	500	11,349.003						

These grids control the “Neutron source parameters” Sample values in the panel located at the left-hand side (see the figure below)

Neutron Source parameters			
Radius (mm)	50.000	Length (mm)	500.000
Bell factor	1.300	Configuration	1 = Wire flat ▼
WGt	0.930	n Factor	0.500
kTh	0.601	kEpi	1.000
pTh	0.964	pEpi	0.820

On the top grid (see figure below), each paramater corresponds to a given calculation method:

	Label	Prefix	Configuration	Bell Factor	WGt	nFactor	kth	kepi	pTh	pEpi
	S84	Z	1 = Wire flat	1.3	0.93	0.5	0.6449	1	0.964	0.820

MatSSF method:

- Bell Factor:
- nFactor:
- WGt:
- Configuration:

CKS method:

- kth:
- kepi:
- pTh:
- pEpi:

18. In order to ASSIGN the (template) neutron source configuration to the sample, DOUBLE-CLICK on the respective row header of the item

For instance, if you select the row “Y4” →

the sample in the left-hand panel will be updated with the incoming values according to the respective calculation method (as shown):

For the MatSSF method

Bell factor	1.300	Configuration	1 = Wire flat
WGt	0.930	n Factor	0.500

For the CKS method

kTh	<input type="text" value="0.601"/>	kEpi	<input type="text" value="1.000"/>
pTh	<input type="text" value="0.964"/>	pEpi	<input type="text" value="0.820"/>

IMPORTANT

The “**Prefix**” column has a special purpose. If a Project is labelled with a prefix letter present in this template list, each added sample will automatically acquire that neutron source configuration.

	Label	Prefix
	S84	Z
▷	Y4	X

- 19.** In order to ASSIGN the (template) neutron source dimensions to the sample, DOUBLE-CLICK on the respective row header of the item

Neutron source dimensions					
		4	of 6		
	Label	Radius Δ	Length	Vol	Comments
	S84	40	300	1,507.964	S84
	PE50	45	220	1,399.580	
	PE20	47	560	3,886.276	
▷	Y4	50	500	3,926.991	Y4
	PE200	60	340	3,845.309	
	P100	85	500	11,349.003	

The following sample values in the left-hand panel will be updated with the incoming values:

Radius (mm)

50.000

Length (mm)

500.000

IMPORTANT

The “**Label**” column in this grid has a special functionality. If a “Neutron source dimension” label matches a “Neutron source configuration” label, then both template items are linked, and each added sample will automatically acquire that neutron source dimension as well.

	Label	Prefix
	S84	Z
▷	Y4	X

Calculations

1. Once your sample has no visible errors or missing input parameters you can calculate the thermal and epithermal neutron self-shielding correction factors.

Sample variables				
Mass (mg)	Radius (mm)	Length (mm)	Density	Volume (cm ³)
981.1	4.080	13.400	1.400	0.701

2.

CALCULATE

3. When calculating, sample status turns Yellow. Samples that were rejected remain Red and an error message is attached to the sample label (see the figure below).

Calculating:

Sample	OK	Gt(M)	Gt(CKS)	MCL	EXS	PXS
170601						
170602						
170603						

4. When finished, the correction factors are obtained and the sample status turns Green (see the figure below).

Finished:

Sample	OK	Gt(M)
170601		
170602		0.9389
170603		0.8864

5. Displaying the epithermal results:

Select the sample of interest → 

The bottom grid will be updated with the respective sample values for each formed nuclide of interest.

Target	Formed	Ge(M)	Ge(CKS)	GFast	Weight	ND	Sig
Ca-44	Ca-45			0.9969	0.41	3.65E-004	2.71E+004
